The method comprises administering conditionally replicative viral vector, where at least one of conditionally replicative viral vector, where at least one of uncleic acids encoding a product essential for its replication operably linked to an H19 regulatory sequence. The method is untreating cancer or hyperproliferative disorders. The cancer is from many different types, for example, carcinoma, sarcoma, addiganglioblastoma. Preferably, the cancer is bladder carcinoma. The sequence encodes the E1a protein of human adenovirus type 5. If linked to a H19 regulatory sequence, and used to produce vector in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating cancer or hyperproliferative disorder comprises admin conditionally replicative viral vector, where the viral nuclei encoding a product essential for its replication is operably 1 H19 regulatory sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example, Fig 7; 122pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-441263/41.

This invention describes novel permanent amniocyte cell lines (A), containing at least one nucleic soid (I) that causes expression of the gene products (II) of the adenoviral EIA and EIB regions. (A) are used to produce gene therapy vectors, especially adeno, adeno-associated, retro or lenti viral vectors, particularly first- or second generation, large-capacity or deleted adenoviral vectors. (A) are also used to produce adenoviral mutants, optionally with modified tropism. The vectors may express a wide range of therapeutic proteins or antisense RNAs. Adenoviral mutants, unable to express the EIB 55 kDa protein, are useful for treating tumors, they replicate in the cells but not significantly in normal primary cells. (A) can be made efficiently, simply and reproducibly. The products of the invention have cytostatic activity. This sequence represents a PCR primer used in the amplification of Adenovirus Ad5 DNA which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                     New permanent amniocyte cell lines, useful for producing viral therapy vectors or mutant adenoviruses, express the adenoviral
                                                                                                                                                                                                                                                                                                                              Example 1; Page 67-72; 72pp; German.

The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents plasmid GRES-E1-SV40-Hygro, which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid comprising for producing high-capacity gene therapy.

Polynucleotide for making vectors, useful for treating ocular diseases, e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repe retinitis pigmentosa, comprises adenovirus inverter termir nces, packaging signal and photoreceptor-specific promoter.

Example 5; Page 139-141; 149pp; English.

The invention provides an isolated polynucleotide comprising adenovirus CC (AV) inverter terminal repeat sequences (ITRS), AV packaging signal CC operatively linked to ITRS and a photoreceptor-specific promoter. A CC recombinant AV vector (AVV) comprising the polynucleotide is useful for CC targeted delivery of a gene product to the eye (especially to the CC degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic CC degenerative disease, retinitis pigmentosa, Stargardt's disease, of a mammal CC preferably human. The AAV comprises a fiber protein that specifically or CC generatively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a CC fiber protein from an adenovirus type D subgroup or is a chimeric protein CC containing a portion of the N-terminus of an adenovirus type 2 or type 5 apoptotic factor, gene encoding a rhodopsin protein, a wild-type stargardt disease gene (STDG1), an anti-cancer agent and a protein that regulates expression of a photoreceptor specific gene product. The viral comprises and packaging signal derived from AAV cubgroup B or C, especially an AV type 2 or type 5. AAV is also useful for targeted gene therapy, where the vector comprises an AV type 37 fiber

This invention relates to novel fibre shaft modifications in adenoviral convectors. Adenoviral vector-mediated gene therapy aims to transduce a specific targeted tissue or organ, accordingly gene therapy requires the specific targeted to transduce and converted to the desired location in the converted peripheral vein would be targeted to the desired location in the converted without any associated side effects, which would permit lower, less toxic vector doses that are also potentially less immunogenic. The converted invention describes capsid modifications, specifically fibre converted to the parin sulphate proteoglycans (HSP) thus providing detargeted binding to heparin sulphate proteoglycans (HSP) thus providing detargeted converted proteins involved in the cell entry pathway such as the fibre knob, penton or CAR (coxsackie adenovirus receptor) proteins, the vectors become fully detargeted. As such, these fully ablated particles can be used in vivo as base vectors such, these fully ablated adenoviruses with the desired cell specificity. This polymucleotide sequence is the plasmid content of the function of the involved complementation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      producing redirected adenoviruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New modified adenovirus capsid protein, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-627459/59

CC The invention describes an isolated nucleic acid (I) comprising consideratively linked to the sequence, and a photoreceptor-specific converter. A Recombinant adenovirus vector (II) comprising (II) is useful corrected delivery of a gene product to the eye of a mammal which convolves administering (II) that comprises heterologous DNA encoding the convolves administering (II) that comprises heterologous DNA encoding the corrected product or resulting in expression of the gene product, where the corrected product or recombinant virus comprises a fibre protein that specifically or combinant virus comprises a fibre protein that specifically or composite in the eye. The recombinant virus comprises a fibre protein containing a sufficient portion of the N-terminus of an adenovirus type 2 or type 5 fibre protein for contraction of an adenovirus type 2 or type 5 fibre protein for corrected mucleic acid comprises a photoreceptor-specific promoter coperatively linked to a nucleic acid comprises a photoreceptor-specific product which is chosen from trophic factor, anti-apoptotic factor, gene encoding a rhodopain protein, will-type Stargards give stargards disease e.g., retinal conditions a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an anti-collar disease such as retinal degenerative disease e.g., retinal convacuative disease, diabetic retinopathies, retinal convacuative disease, diabetic retinopathies, retinal convacuative disease, diabetic retinopathies, retinal convacuative disease, and an adenovirus packaging signal operatively linked to the sequence. The ITRs and packaging signal correcter (II) includes photoreceptor proventers providing a means not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ophthalmological; antiinflammatory; antidiabetic; gene therapy; adenovirus inverted terminal repeat sequence; adenovirus inverted terminal repeat sequence; adenovirus packaging signal; photoreceptor-specific promoter; adenovirus type 37; adenovirus type 0 serotype; adenovirus type 2; adenovirus type 5; photoreceptor; trophic factor; anti-apoptotic factor; rhodopsin; wild-type Stargardt disease gene; STDG1; anti-cancer agent; retinal degenerative disease; retinitis pigmentosa; Stargardt's disease; diabetic retinopathy; retinal vascularisation; choroideraemia; gyrate atrophy; macular dystrophy; retinoblastoma; photoreceptor-restricted transgene expression; special procession; addressions and control of the started transgene expression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acids comprising adenovirus inverted terminal repeat sequences, adenovirus packaging signals operatively linked to the sequences and photoreceptor-specific promoters, useful for treating retinitis pigmentosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         recombinant adenovirus vector; adenovirus type 5; E1; chromosomal insertion; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo sapiens
promoter. (II) includes photoreceptor promoters providing a means not only for specific targeting of expression in these cells, but also for photoreceptor-restricted transgene expression. This sequence represents chromosomal insetion found in adenoviral plasmids of the A549 lung carcinoma cell line which provide a complement of adenoviral El gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 5; Page 90-93; 106pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2003-657234/62

The invention describes an isolated nucleic acid molecule (I) comprising CC an adenovirus tripartite leader (TPL) nucleotide, the TPL nucleotide CC sequence comprising a first and second different TPL exons or first, CC second and third same or different TPL exons, the TPL exons chosen from CC complete or partial TPL exon 1, complete TPL exon 2 and complete TPL exon 2.

CC animal, or for producing a putless adenoviral vector particle. A CC recombinant adenovirus particle (II) is useful for delivery of an CC exogenous gene to a target cell which involves contacting the cell with an amount of (II) sufficient to infect the cell. A helper-independent CC producing an adenovirus vector particle containing (III) which involves contacting the cell with involves contacting the cell with involves contacting the cell with involves contacting an adenovirus vector particle containing (III) which involves contacting and packaging cell line which is deficient in expressing containing particles and harvesting the particle produced by the cell containing particles and harvesting the particle produced by the cell involves complementing a missing fiber gene of (III) or helper-dependent fiber prosecutory gene of (III) or helper-dependent cells a fiber gene from a different adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenovirus such as hereditary gene therapy. (II) is useful for treating diseases such as hereditary of diserupt HIV infection. This sequence represents construct GRE5-2.E1, a plasmid inserted into the chromosomal DNA of lung carcinoma line A59.

The present sequence is that of a pDBX/B1 plasmid used in the method of CC the invention. The plasmid contains an adenovirus type 5 (AD5) E1 CC regulatory gene controlled by a mouse mammary tumour virus (MMTV) CC promoter. The invention provides adenoviral vectors having deletions of CC all or part of various gene sequences encoding adenoviral structural CC proteins and/or early region proteins. Deletions in these proteins would CC allow a reduced risk of wild-type virus contamination and would also CC diagnostic and therapeutic applications. The adenoviral vectors having CC deletions in the structural and/or early gene regions are produced by CC cellular complementation of these adenoviral genes. Therefore, the CC pDEX/B1 plasmid was used as a complementation plasmid which was CC introduced into a host cell line where parts of the B1 gene region would CC be stably inserted into the host cell chromosomes. The resulting E1 gene CC discasses (e.g. Huntington's disease, Tay-Sachs (e.g. tumours), genetic CC diseases (e.g. Huntington's disease, They can also be used for disease), or infections (e.g. HIV infection). They can also be used for CC controduction of biologically active proteins. (Updated on 25-MAR-CC 2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (NOVS )

The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL exons. The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenoviral vector particle. The present sequence represents an El expressing plasmid, which is used for complementation of El-gene deleted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 156-159; 212pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC (AV) invertien provides an isolated polynucleotide comprising adenovirus CC (AV) inverter terminal repeat sequences (ITRS), AV packaging signal CC operatively linked to ITRS and a photoreceptor-specific promoter. A CC recombinant AV vector (AVV) comprising the polynucleotide is useful for CC vitreous cavity), for treating an ocular disease, e.g., rethnal CC degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic critinopathies, retinal vascularizations, and retinoblastoma, of a mammal CC preferably human. The AAV comprises a fiber protein that specifically or CC selectively binds to receptors that are expressed on cells (preferably CC photoreceptors in the eye). Preferably, the recombinant virus comprise a CC fiber protein from an adenovirus type D subgroup or is a chimeric protein CC containing a portion of the N-terminus of an adenovirus type 2 or type 5 cc penton, and the therapeutic product is a trophic factor, an anti-CC apoptotic factor, gene encoding a rhodopsin protein, a wild-type CC stargardt disease gene (STDGI), an anti-cancer agent and a protein that cregulates expression of a photoreceptor specific gene product. The viral cucleic acid of AAV comprises ITRS and packaging signal derived from AAV subgroup B or C, especially an AV type 2 or type 5. AAV is also useful CC protein or its portion, and selectively transduces photoreceptors and CC delivers a gene product encoded by AAV. The present sequence represents CC an expression plasmid pdEX/El containing the adenovirus El gene
                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention describes an isolated nucleic acid (I) comprising CC adenovirus inverted terminal repeat sequence, an adenovirus packaging CC signal operatively linked to the sequence, and a photoreceptor-specific CC promoter. A Recombinant adenovirus vector (II) comprising (I) is useful CC involves administering (II) that comprises heterologous DNA encoding the CC involves administering (II) that comprises betterologous DNA encoding the CC gene product or resulting in expression of the gene product, where the recombinant virus comprises a fibre protein that specifically or CC gelectively binds to receptors that are expressed on cells which are CC photoreceptors, in the eye. The recombinant virus comprises a fibre protein which is an adenovirus type 37, from an adenovirus type D grotein which is an adenovirus type 37 from an adenovirus type D containing a sufficient portion CC of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 penton, and a sufficient portion of an adenovirus serotype D knob portion of the fiber for call comprises a photoreceptor-specific promoter encapsulated nucleic acid comprises a photoreceptor-specific promoter operatively linked to a nucleic acid comprising the therapeutic product

CC which is chosen from trophic factor, anti-apoptotic factor, gene encoding CC a rhodopsin protein, wild-type Stargardt disease gene (STDG1), an anti-cancer agent and a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an CC ocular disease such as retinal degenerative disease e.g., retinitis CC pigmentosa, Stargardt's disease, diabetic retinopathies, retinal CC vascularisation, choroideraemia, gyrate atrophy or macular dystrophy or retinoblastoma inherited and acquired retinal and neovascular degenerative diseases. The viral nucleic acid comprises an adenovirus converted terminal repeat (ITR) sequence, and an adenovirus packaging CC inverted terminal repeat (ITR) sequence, and an adenovirus type 2 or converted from an adenovirus sequence. The ITRs and packaging signal CC are derived from an adenovirus sequence aphotoreceptor-specific promoter. (II) includes photoreceptor promoters providing a means not CC only for specific targeting of expression in these cells, but also for photoreceptor-restricted transgene expression. This sequence represents CC an adenovirus 11-expressing plasmid for complementation of an E1-gene-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

```
The invention describes an isolated nucleic acid molecule (I) comprising comparising a first and second different TPL exons or first, sequence comprising a first and second different TPL exons or first, complete or partial TPL exon 1, complete TPL exon 2 and complete TPL exon 2.

(C) animal, or for producing a putless adenoviral vector particle. A complete TPL exon 2 and complete TPL exon 2.

(C) animal, or for producing a putless adenoviral vector particle. A complete TPL exon 2 and complete TPL exon 2 a

```
CC invention provides adenoviral vectors having deletions of all or part of C various gene sequences encoding adenoviral structural proteins and/or CC early region proteins. Deletions in these proteins would allow a reduced CC risk of wild-type virus contamination and would also allow packaging of C foreign DNA in such vectors for a variety of distinct and therapeutic CC applications. The adenoviral vectors having deletions in the structural CC and/or early gene regions are produced by cellular complementation of C these adenoviral genes. Therefore, the pgl/Fiber plasmid was used as a CC complementation plasmid which was introduced into a host cell line where CC parts of the fiber and El gene region would be stably inserted into the host cell chromosomes. The resulting El/fiber gene deficient plasmid can be used as a gene delivery vector. The vectors can be used for diagnosis C or gene therapy, e.g. for treating conditions characterised by hyper-CC disease, Tay-Sachs disease, or sickle cell diseases (e.g. Huntington's Cd disease, Tay-Sachs disease, or sickle cell disease (e.g. Huntington's C disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. timours), genetic disease (e.g. Huntington's C disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. timours), genetic disease (e.g. Huntington's C disease), and the contraction of contract PI or field's cally active proteins. (Updated on 25-MAR-2003 to correct PI
